Consider using this encoder-decoder model for machine translation. point

This model is a "conditional language model" in the sense that the encoder portion (shown in green) is modeling the probability of the input sentence x.

True

False

Correct

In beam search, if you increase the beam width B, which of the following would you expect to be true? Check all that apply.

Beam search will run more slowly. point

Correct

Correct

True

 $P(\hat{y} \mid x) = 1.09 * 10^{-7}$

point

point

point

Beam search will use up more memory.

Beam search will generally find better solutions (i.e. do a better job maximizing $P(y \mid x)$)

Correct

Un-selected is correct

In machine translation, if we carry out beam search without using sentence normalization, the

algorithm will tend to output overly short translations.

Beam search will converge after fewer steps.

Correct False

value of y that maximizes $P(y \mid x)$. On a dev set example, given an input audio clip, your algorithm outputs the transcript $\hat{y}=$ "I'm building an A Eye system in Silly con Valley.", whereas a human gives a much superior

Suppose you are building a speech recognition system, which uses an RNN model to map

from audio clip x to a text transcript y. Your algorithm uses beam search to try to find the

transcript $y^*=$ "I'm building an AI system in Silicon Valley." According to your model,

 $P(y^* \mid x) = 7.21 * 10^-8$

Would you expect increasing the beam width B to help correct this example?

RNN rather than to the search algorithm. Correct

No, because $P(y^* \mid x) \leq P(\hat{y} \mid x)$ indicates the error should be attributed to the

No, because $P(y^* \mid x) \leq P(\hat{y} \mid x)$ indicates the error should be attributed to the search algorithm rather than to the RNN.

Yes, because $P(y^* \mid x) \leq P(\hat{y} \mid x)$ indicates the error should be attributed to the RNN rather than to the search algorithm.

Yes, because $P(y^* \mid x) \leq P(\hat{y} \mid x)$ indicates the error should be attributed to the search algorithm rather than to the RNN.

Continuing the example from Q4, suppose you work on your algorithm for a few more weeks, and now find that for the vast majority of examples on which your algorithm makes a mistake, $P(y^* \mid x) > P(\hat{y} \mid x)$. This suggest you should focus your attention on improving the search algorithm. point True.

Correct False.

Consider the attention model for machine translation.

Further, here is the formula for $\alpha^{< t,t'>}$.

Q<t-1> Q<t>

Which of the following statements about $\alpha^{< t,t'>}$ are true? Check all that apply. We expect $\alpha^{< t,t'>}$ to be generally larger for values of $a^{< t'>}$ that are highly relevant to the value the network should output for $y^{< t>}$. (Note the indices in the superscripts.)

Correct

We expect $\alpha^{< t,t'>}$ to be generally larger for values of $a^{< t>}$ that are highly relevant to the value the network should output for $y^{< t'>}$. (Note the indices in the superscripts.)

Un-selected is correct

computed using a small neural network:

Un-selected is correct

Correct

Correct

when:

Correct

Correct

10. In trigger word detection, $x^{< t>}$ is:

point

 $\sum_{t} \alpha^{\langle t,t'\rangle} = 1 \text{ (Note the summation is over } t.)$

 $\sum_{t'} \alpha^{\langle t,t' \rangle} = 1 \text{ (Note the summation is over } t'.)$

The network learns where to "pay attention" by learning the values $e^{< t,t'>}$, which are

We can't replace $s^{< t-1>}$ with $s^{< t>}$ as an input to this neural network. This is because $s^{< t>}$ depends on $\alpha^{< t,t'>}$ which in turn depends on $e^{< t,t'>}$; so at the time we need to evalute this point network, we haven't computed $s^{< t>}$ yet. True

False

Compared to the encoder-decoder model shown in Question 1 of this quiz (which does not

use an attention mechanism), we expect the attention model to have the greatest advantage

The input sequence length T_x is large.

The input sequence length T_x is small.

Under the CTC model, identical repeated characters not separated by the "blank" character (_)

__c_oo_o_kk___b_ooooo__oo__kkk point cokbok cookbook

are collapsed. Under the CTC model, what does the following string collapse to?

cook book coookkbooooookkk

Features of the audio (such as spectrogram features) at time t. Correct

The t-th input word, represented as either a one-hot vector or a word embedding.

Whether the trigger word is being said at time t.

Whether someone has just finished saying the trigger word at time t.
